

Lecture 6: More MLEs

Consider the Bernoulli but w/ a parameter

$$\eta = \frac{p}{1-p} = \text{odds}$$

What is the MLE for η ?

$$\eta = \frac{p}{1-p} \Leftrightarrow p = \frac{\eta}{1+\eta}$$

Get the likelihood in terms of η

$$L(p) = p^{N\bar{x}} (1-p)^{N-N\bar{x}}$$

$$L(\eta) = \left(\frac{\eta}{1+\eta} \right)^{N\bar{x}} \left(1 - \frac{\eta}{1+\eta} \right)^{N(1-\bar{x})}$$

$$\hat{\eta} = \underset{\eta}{\operatorname{argmin}} L(\eta)$$

① Get $\frac{\partial \ell}{\partial \eta}$

$$\begin{aligned} \ell(\eta) = \log L(\eta) &= N\bar{x} \log\left(\frac{\eta}{1+\eta}\right) \\ &\quad + N(1-\bar{x}) \log\left(\frac{1}{1+\eta}\right) \end{aligned}$$

$$\begin{aligned} &= N\bar{x} (\log(\eta) - \log(1+\eta)) \\ &\quad - N(1-\bar{x}) \log(1+\eta) \end{aligned}$$

$$\frac{\partial \ell}{\partial \eta} = N\bar{x}/\eta - \frac{N\bar{x}}{1+\eta} - N\frac{1}{1+\eta} + \frac{N\bar{x}}{1+\eta}$$

$$= \frac{N\bar{x}}{\eta} - \frac{N}{1+\eta}$$

(2) Set eq. to zero, solve for η .

$$\frac{N\bar{x}}{\eta} = \frac{N}{1+\eta} \Rightarrow N\bar{x} + N\eta\bar{x} = \eta N$$

$$\Rightarrow \bar{x} = \eta(1-\bar{x})$$

$$\Rightarrow \boxed{\hat{\eta} = \frac{\bar{x}}{1-\bar{x}}}$$

Recall: $\eta = p/(1-p)$ and $\hat{p} = \bar{x}$

curiously, $\hat{\eta} = \hat{p}/(1-\hat{p})$

Theorem: Transformations of MLEs

If $\hat{\theta}$ is the MLE for θ then
the MLE for $g(\theta)$ is $g(\hat{\theta})$.

Ex. $X_n \stackrel{iid}{\sim} \text{Pois}(\lambda)$, $\lambda > 0$.
Let's get MLE $\hat{\lambda}$.

$$\textcircled{1} L(\lambda) = f_{\lambda}(x) = \prod_n f(x_n) = \prod_n \frac{\lambda^{x_n} e^{-\lambda}}{x_n!}$$
$$\rightarrow = \lambda^{\sum_n x_n} e^{-N\lambda} \prod_n \left(\frac{1}{x_n!} \right)$$

$$l(\lambda) = \left(\sum_n x_n \right) \log(\lambda) - N\lambda + \log\left(\prod_n \frac{1}{x_n!} \right)$$

$\textcircled{2}$ Take deriv, set to zero.

$$\frac{\partial l}{\partial \lambda} = \left(\sum_n x_n \right) \frac{1}{\lambda} - N = 0$$

$$\Rightarrow \boxed{\hat{\lambda} = \frac{1}{N} \sum_n x_n = \bar{X}}$$

What's the MLE of $\theta = \log(\lambda)$?

$$\hat{\theta} = \log(\hat{\lambda}) = \log(\bar{X}).$$

Ex. $X_n \stackrel{iid}{\sim} \text{Exp}(\lambda)$

let's get MLE $\hat{\lambda}$.

$$\textcircled{1} L(\lambda) = \prod_n f(x_n) = \prod_n \lambda e^{-\lambda x_n} \mathbb{1}(x_n > 0) \\ = \lambda^N e^{-\lambda \sum_n x_n}$$

$$\ell(\lambda) = \log L(\lambda)$$

$$= N \log(\lambda) - \lambda \sum_n x_n$$

$$\frac{\partial \ell}{\partial \lambda} = \frac{N}{\lambda} - \sum_n x_n = 0$$

$$\Rightarrow \frac{N}{\lambda} = \sum_n x_n \Rightarrow \boxed{\hat{\lambda} = \frac{N}{\sum_n x_n} = \frac{1}{\bar{x}}}$$

$$E[\text{Exp}(\lambda)] = 1/\lambda$$

Sometimes people parameterize the Exp in terms of $\beta = 1/\lambda$

i.e. $f(x_n) = \frac{1}{\beta} e^{-x_n/\beta}$ so that $E[\text{Exp}(\beta)] = \beta$

What's the MLE for β ? $1/\hat{\lambda} = 1/(1/\bar{x}) = \bar{x}$

Ex. let $X_n \stackrel{iid}{\sim} U(0, \theta)$ for $\theta > 0$
What's the MLE for θ ?

$$\begin{aligned} \textcircled{1} \quad L(\theta) &= \prod_n \frac{1}{\theta} \mathbb{1}(0 \leq x_n \leq \theta) \\ &= \theta^{-N} \prod_n \mathbb{1}(x_n \geq 0) \prod_n \mathbb{1}(x_n \leq \theta) \\ &= \theta^{-N} \mathbb{1}(x_{(1)} \geq 0) \mathbb{1}(x_{(N)} \leq \theta) \end{aligned}$$

$$\boxed{\hat{\theta} = x_{(N)}}$$

Ex. $X_n \stackrel{iid}{\sim} N(\theta, 1)$ where $\theta \geq 0$

$$\begin{aligned} \text{Consider } L(\theta) &= \prod_n \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{1}{2}(x_n - \theta)^2\right) \\ &= (2\pi)^{-N/2} \exp\left(-\frac{1}{2} \sum_n (x_n - \theta)^2\right) \end{aligned}$$

$$l(\theta) = -\frac{N}{2} \log(2\pi) - \frac{1}{2} \sum_n (x_n - \theta)^2$$

a quadratic in θ
 $\sim -\theta^2$

$$\hat{\theta} = \arg \max_{\theta \in \Theta} L(\theta)$$

$$\Theta = [0, \infty)$$

Case 1: $\bar{X} \geq 0$ so $\hat{\theta} = \bar{X}$

Case 2: $\bar{X} < 0$ so $\hat{\theta} = 0$

$$\hat{\theta} = \max(0, \bar{X})$$

Ex. $X_n \stackrel{iid}{\sim} N(\mu, \sigma^2)$ both unknown.

Let's get MLE for μ and σ^2 . [$\mu \in \mathbb{R}, \sigma^2 > 0$]

$$\begin{aligned} \textcircled{1} L(\mu, \sigma^2) &= \prod_n \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{1}{2\sigma^2}(x_n - \mu)^2\right) \\ &= (2\pi)^{-N/2} (\sigma^2)^{-N/2} \exp\left(-\frac{1}{2\sigma^2} \sum_n (x_n - \mu)^2\right) \end{aligned}$$

$$l(\mu, \sigma^2) = \log L(\mu, \sigma^2)$$

$$= -\frac{N}{2} \log(2\pi) - \frac{N}{2} \log(\sigma^2) - \frac{1}{2\sigma^2} \sum_n (x_n - \mu)^2$$

$$(2) \quad \frac{\partial l}{\partial \mu} = 0 \quad \text{and} \quad \frac{\partial l}{\partial \sigma^2} = 0 \quad \left[\frac{\partial l}{\partial \tau} = 0 \right]$$

$$l(\mu, \tau) = -\frac{N}{2} \log(2\pi) - \frac{N}{2} \log(\tau) - \frac{1}{2\tau} \sum_n (x_n - \mu)^2$$

$$\begin{aligned} \frac{\partial l}{\partial \mu} &= -\frac{1}{2\tau} \sum_n 2(x_n - \mu)(-1) = \frac{1}{\tau} \sum_n (x_n - \mu) \\ &= \frac{1}{\tau} (\sum_n x_n - N\mu) = 0 \end{aligned}$$

$$\Rightarrow \sum_n x_n - N\mu = 0$$

$$\Rightarrow \boxed{\hat{\mu} = \frac{1}{N} \sum_n x_n = \bar{x}}$$

$$\frac{\partial l}{\partial \tau} = -\frac{N}{2} \frac{1}{\tau} + \frac{1}{2\tau^2} \sum_n (x_n - \mu)^2 = 0$$

$$\Rightarrow -\frac{N}{\tau} + \frac{1}{\tau^2} \sum_n (x_n - \mu)^2 = 0$$

$$\Rightarrow \frac{1}{\tau} \sum_n (x_n - \mu)^2 = N$$

$$\Rightarrow \frac{1}{N} \sum_n (x_n - \mu)^2 = \tau$$

$$\boxed{\hat{\tau} = \hat{\sigma}^2 = \frac{1}{N} \sum_n (x_n - \hat{\mu})^2 = \frac{1}{N} \sum_n (x_n - \bar{x})^2}$$

Ex. $X_n \stackrel{iid}{\sim} \text{Laplace}(\mu, \sigma^2)$

$$f(x) = \frac{1}{2\sigma} \exp\left(-\frac{1}{\sigma}|x-\mu|\right)$$

what's the MLE?

$$\begin{aligned} \textcircled{1} L(\mu, \sigma) &= \prod_n \frac{1}{2\sigma} \exp\left(-\frac{1}{\sigma}|x_n - \mu|\right) \\ &= 2^{-N} \sigma^{-N} \exp\left(-\frac{1}{\sigma} \sum_n |x_n - \mu|\right) \end{aligned}$$

$$\ell(\mu, \sigma) = -N \log(2) - N \log(\sigma) - \frac{1}{\sigma} \sum_n |x_n - \mu|$$

Problem, not differentiable WRT μ .

Can look at $\frac{\partial \ell}{\partial \sigma}$.

$$\frac{\partial \ell}{\partial \sigma} = -\frac{N}{\sigma} + \frac{1}{\sigma^2} \sum_n |x_n - \mu| = 0$$

$$\hat{\sigma} = \frac{1}{N} \sum_n |x_n - \hat{\mu}|$$

$$e^{-a}$$

$$L(\mu, \sigma) \propto \exp\left(-\frac{1}{\sigma} \underbrace{\sum_n |x_n - \mu|}_a\right)$$

decreases as a increases.

So to maximize, should make a as small as possible.

$$\min \underbrace{\sum_n |x_n - \mu|}_{\text{total dist of } \mu \text{ to } x_n}$$

$$\bar{x} = \operatorname{argmin}_{\mu} \sum_n (x_n - \mu)^2$$

Turns out μ should be median(x_n).
